## EXPERIENCE

---

### Genetec

Cloud Operations Analyst Intern

Jan 2026 – Present

- Built internal VM power scheduling platform using **React TypeScript** and **Genetec's proprietary component framework**
- Wired client-side routing and server-state management via **TanStack Router** and **TanStack Query**
- Provisioned and version-controlled cloud infrastructure on **Azure** using **Terraform**
- Enabled integration testing within an **Azure Function App** by identifying and incorporating a compatible third-party module
- Upheld UI/UX best practices across all delivered interfaces, ensuring a consistent and intuitive user experience
- Engineered backend data layer using **Microsoft SQL** with DB contexts, typed serialization, and field-level JSON validation

### Plazio

Software Developer Intern

Sep 2025 – Apr 2026

- Architected an event-driven email pipeline using **SQL triggers**, **Supabase Edge Functions**, and **Resend**
- Built a reusable **React Email** component system with a shared base template for visual consistency across all email types
- Provisioned **GCP** logging infrastructure using **Terraform**, routing logs through **Cloud Logging** and **Pub/Sub**
- Deployed a full observability stack with **Grafana**, **Loki**, and **OpenTelemetry** for log aggregation and distributed tracing

### Vocality

Software Developer Intern

Dec 2024 – Jan 2026

- Integrated **PostHog** analytics into a **C#/.NET** application, enabling real-time tracking of user behavior
- Refactored a **legacy codebase** using **object-oriented design principles**, improving maintainability and reducing technical debt
- Designed and maintained **PostHog dashboards** to surface actionable insights on user behavior and preferences
- Implemented a **SQLite-backed offline persistence layer** to batch analytics events and ensure reliable delivery under **intermittent network conditions**

## PROJECTS

---

### 3D Portfolio Website | React.js, Three.js, Blender

Jul 2025 – Ongoing

- Architected a real-time **3D Boid algorithm** for 100+ GLTF birds with custom flocking behavior
- Implemented a **finite state machine** to orchestrate scene and UI flow, replacing ad-hoc conditionals
- Applied the **Observer pattern** to decouple rendering, data loading, and UI, improving scalability
- Optimized resource usage with lazy initialization via the **Singleton pattern**
- Reduced **O(n<sup>2</sup>)** bottleneck to **O(kn)** via adaptive spatial hash grid, sustaining 60fps
- Built a **real-time 3D visualization system** arranging objects into scalable grid layouts
- Automated **adaptive text placement** in dynamic environments to improve readability

## TECHNICAL SKILLS

---

**Programming Languages:** Java, Python, C#, JavaScript, TypeScript, SQL (PostgreSQL, MySQL), HTML/CSS  
**Frameworks & Libraries:** React.js, Node.js, Three.js, React Native, Flask, Jest, SpringBoot, Dotnet  
**Tools & Platforms:** Git, Postman, Azure, GCP, Terraform, Grafana, Supabase, PostHog, OpenTelemetry, SQLite  
**Languages:** English – Fluent, Russian – Fluent, French – Conversational

## EDUCATION

---

### Concordia University

Bachelor of Software Engineering

Sep 2022 – May 2027

- **Relevant Coursework:** Software Architecture and Design, Data Systems for Software Engineers, Computer Networks, Software Requirements and Deployment, Software Testing and QA
